--- END NOTE ---

This is a computer-generated mock report created for software testing purposes only. Not derived from any real patient data.

EXPECTED BEHAVIOR: Structured panel data should extract normally (FBG 109 = prediabetes range, HbA1c 5.9 = prediabetes range, BMI 25.9 = overweight/obese depending on cutoff used). The handwritten note is free text, not structured data – tests whether extraction correctly leaves it OUT of the structured JSON (no "family history" field exists in your schema) rather than trying to extract "diabetes" as a value, or whether it gets confused by the extra unstructured text and misreads the table above it.
